Gadget Mapping GUI – Folder Structure Explained (1–14)

This document provides a detailed, non-technical explanation of each folder used by the Gadget Mapping GUI. It is intended for operational users, auditors, and stakeholders who need to understand how files move through the system and what each folder represents.

1. Inbox

This is the starting point of the process. Users place incoming client CSV files into this folder to begin processing. The Inbox acts as a temporary holding area only. Files should not remain here once processing begins, as they will be moved automatically to either Processed or Failed.

2. Inbox\YYYY-MM

This optional subfolder allows users to control the invoice month explicitly. When a file is placed inside a folder named in YYYY-MM format, the system automatically assigns that invoice month to the file. This prevents accidental processing into the wrong month and removes the need for manual month selection.

3. Processed

This folder stores successfully processed files. Files are archived by invoice month and timestamped to preserve an audit trail. Files in this folder confirm that processing completed successfully and are never reprocessed automatically.

4. Failed

Files that cannot be processed are moved here. Each failure creates a structured failure pack containing the original file, a summary of the error, detailed diagnostics, detected headers, and the mapping used. This allows controlled investigation, correction, and retry without data loss.

5. Mappings

This folder stores saved JSON mapping files that define how a client's data fields map to Gadget's standard structure. Once a mapping is saved, future files from the same client can be processed automatically without remapping.

6. out

This is the root output directory for all processing results. All generated outputs are written beneath this folder and organised by invoice month.

7. out\YYYY-MM

Each invoice month has its own folder. This ensures complete separation of data by period and simplifies reconciliation, audit, and reprocessing for a specific month.

8. out\YYYY-MM\clean_csv

This folder contains the standardised Clean CSV files produced by Workflow 1. These files are the authoritative source of truth for all downstream workflows including invoicing and bordereau reporting.

9. out\YYYY-MM\workflow2_micro

This folder contains micro-level summaries showing member counts and gross premium totals by cover level and pricing bucket. It is primarily used for validation and sense-checking.

10. out\YYYY-MM\workflow2_invoice

This folder contains invoice-ready summary files. These reports calculate gross premium, IPT, and total invoice amounts and are typically shared externally or used for billing.

11. out\YYYY-MM\workflow2_invoice backup

This folder contains line-level invoice backup data. It provides full transparency into how each invoice figure was calculated and supports audit, reconciliation, and dispute resolution.

12. out\YYYY-MM\workflow2_exceptions

This folder captures any rows that could not be processed cleanly due to missing, invalid, or unexpected data. Nothing is silently excluded; all exceptions are explicitly reported.

13. out\YYYY-MM\workflow2_control

This folder contains control and reconciliation reports. These reports summarise row counts, client counts, and total values to confirm completeness and consistency of processing.

14. out\YYYY-MM\bordereau

This folder contains regulatory and insurer reporting outputs. It includes the monthly bordereau (one row per client per month) and the master bordereau (one row per client across all months).
